

# DUPLEX V9 & V10 SLIMLINE CERAMIC VALVES

V9 is the second of our slimline ceramic valves, a duplex valve suitable for all engines up to about 200hp (3/8" fuel lines).

Rotax now call for 3/8" lines for all their engines which seems odd to me given the size of the fuel fittings on their smaller engines. Anyway V9 will do the job.

V6 is available for 6mm fuel lines

V9 will go into a space of about 60mm wide and is supplied with mounting screws and a selector plate, either our standard 70mm dia or 54 mm. The 70mm installation matches our earlier valves and side entry banjos match other layouts. Available as 3 way or 4 way including a selection for both.

All the ports are tapped 1/4" nps to accept banjo bolts and npt fittings

Available with 3 way or 4 way (with 'Both') selectors

The price is less than Andair and I am very pleased with the quality of the product.

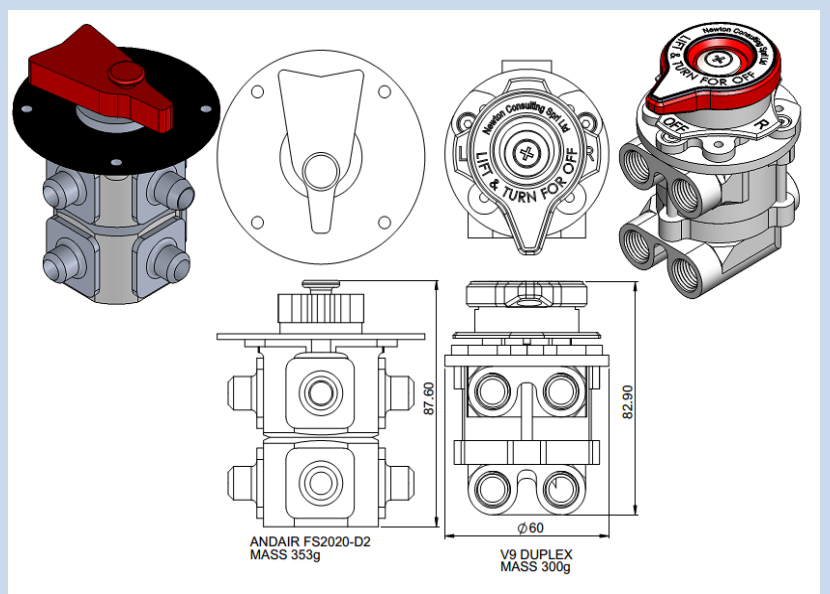

Available with a remote drive and a small selector plate to reduce the footprint in the cockpit

Our very reasonable AN-6 banjos will facilitate fuel entry from the sides or below. A variety of commercial 1/4" npt fittings are available for other fuel line systems

V10 is rather fun, we have designed a clever pressure relief system into V9 making V10. It will cost a little more (+£20 is the current proposal) and protect the engine systems after shut down.
